

ABSTRACT

The destruction of the rainforests in the last decades has become the biggest crime against humanity, animals and Nature. Various statistics show that at the current rate of destruction, unless drastic changes are made right now, by the year 2020 or even considerably earlier, 90-100% of all the rainforests will be irrevocably destroyed, causing damages that will take MILLIONS OF YEARS to repair, if at all. The present invention tries to solve this by creating a strong financial incentive that makes preserving the rain forests much more profitable than destroying them. Preferably sustainable harvesting is combined with selling real acres to people and making sure that these acres are indeed under supervision and protection and that preferably as many of them as possible are also used for sustainable harvesting. This is preferably combined with a recursive multi-level marketing plan with various sophisticated improvements over the prior art.
